REC_Python_Week 6_CY

Attempt : 1 Total Mark : 40

Marks Obtained: 36.5

Section 1: Coding

1. Problem Statement

Write a program to obtain the start time and end time for the stage event show. If the user enters a different format other than specified, an exception occurs and the program is interrupted. To avoid that, handle the exception and prompt the user to enter the right format as specified.

Start time and end time should be in the format 'YYYY-MM-DD HH:MM:SS'If the input is in the above format, print the start time and end time.If the input does not follow the above format, print "Event time is not in the format"

Input Format

The first line of input consists of the start time of the event.

The second line of the input consists of the end time of the event.

Output Format

If the input is in the given format, print the start time and end time.

If the input does not follow the given format, print "Event time is not in the format".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 2022-01-12 06:10:00 2022-02-12 10:10:12 Output: 2022-01-12 06:10:00 2022-02-12 10:10:12

Answer

```
# You are using Python
from datetime import datetime

def validate_event_time():
    try:
        start_time_input = input()
        end_time_input = input()
        format_string = '%Y-%m-%d %H:%M:%S'
        start_time = datetime.strptime(start_time_input, format_string)
        end_time = datetime.strptime(end_time_input, format_string)
        print(start_time_input, end_time_input)

except ValueError:
    print("Event time is not in the format")
validate_event_time()
```

Status: Correct Marks: 10/10

2. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and

desired password. Password validation criteria include:

Length between 10 and 20 characters. At least one digit. At least one special character from !@#\$%^&* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

Input Format

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

Output Format

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: John 9874563210 john john1#nhoj Output: Valid Password

Answer

name = input().strip()
mobile = input().strip()
username = input().strip()
password = input().strip()

if not any(ch.isdigit() for ch in password):

```
print("Should contain at least one digit")
elif not any(ch in "!@#$%^&*" for ch in password):
    print("It should contain at least one special character")
elif not (10 <= len(password) <= 20):
    print("Should be a minimum of 10 characters and a maximum of 20 characters")
else:
    print("Valid Password")</pre>
```

Status: Partially correct Marks: 6.5/10

3. Problem Statement

Implement a program that checks whether a set of three input values can form the sides of a valid triangle. The program defines a function is_valid_triangle that takes three side lengths as arguments and raises a ValueError if any side length is not a positive value. It then checks whether the sum of any two sides is greater than the third side to determine the validity of the triangle.

Input Format

The first line of input consists of an integer A, representing side1.

The second line of input consists of an integer B, representing side2.

The third line of input consists of an integer C, representing side3.

Output Format

The output prints either "It's a valid triangle" if the input side lengths form a valid triangle,

or "It's not a valid triangle" if they do not.

If there is a ValueError, it should print "ValueError: <error_message>".

Refer to the sample output for the formatting specifications.

```
Sample Test Case
Input: 3
Output: It's a valid triangle
Answer
# You are using Python
def is_valid_triangle(a, b, c):
  if a <= 0 or b <= 0 or c <= 0:
     raise ValueError("Side lengths must be positive")
  if a + b > c and a + c > b and b + c > a:
    return True
  else:
     return False
  side1 = int(input())
  side2 = int(input())
  side3 = int(input())
  if is_valid_triangle(side1, side2, side3):
     print("It's a valid triangle")
  else:
     print("It's not a valid triangle")
except ValueError as ve:
  print(f"ValueError: {ve}")
```

Marks: 10/10 Status: Correct

4. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

2716240701245 The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted_names.txt.

The input consists of multiple lines, each containing a name represented as a string.

To end the input

To end the input and proceed with sorting, the user can enter 'q'.

Output Format

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

Sample Test Case

```
Input: Alice Smith
John Doe
Emma Johnson
Output: Alice Smith
Emma Johnson
John Doe
```

Answer

```
# You are using Python
def name_sorter():
names = []
  while True:
    name = input()
    if name.strip().lower() == 'q':
      break
    names.append(name.strip())
  sorted_names = sorted(names)
  with open("sorted_names.txt", "w") as file:
    for name in sorted_names:
      file.write(name + "\n")
  for name in sorted_names:
    print(name)
name_sorter()
```
